Also disclosed is a method for evaluating rice blast fungus (Pyricularia oryzae) and Magnaporthe grisea sensitivity to scytalone dehydrogenase inhibitors. The gene is useful for screening for new SCDH inhibitors a evaluating sensitivity to them. The current sequence represents the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                        Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polynucleotide encoding polypeptide, antibody specific to polypeptide or T cell expressing polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1;

hybridising to (IV) and comparing the amount to a predetermined cutoff value and thereby detecting ovarian cancer in the patient, where the amount of polymucleotide hybridising to (IV) is detected preferably by polymerase chain reaction (PCR). (I) comprising (III) and/or (II) is useful for stimulating and/or expanding T cells specific for an ovarian tumour protein comprising contacting T cells with (III) or (II). (III) is useful in design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in tumour cells; and to isolate a full length gene from a suitable library e.g., a tumour CDNA library length gene from a suitable library e.g., a The present invention describes a composition (I) comprising: carriers and immunostimulants; and a polypoptide (II) of a ovarian tumour polypoptide encoded by a polypuclectide (III) having a cDNA sequence (S1) from the 10912 nucleotide sequences as given in ABL77023 to ABL87934, (III) encoding (II) having a sequence (S2), a T cell population of (II), or antigen presenting cells that express (II). (I) has cytostatic activity. An oligonucleotide (IV) that hybridises to (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises contacting a biological sample from a patient with (IV), detecting the amount of polynucleotide behalf of the patient of the polynucleotide behalf of the polynucleotide of the patient of the polynucleotide behalf of the patient with (IV), detecting the amount of polynucleotide behalf of the patient with (IV), detecting the amount of polynucleotide behalf of the patient with (IV), detecting the amount of polynucleotide behalf of the patient with (IV), detecting the amount of polynucleotide behalf of the patient with (IV), detecting the amount of polynucleotide behalf of the patient with (IV), detecting the amount of polynucleotide behalf of the patient with (IV), detecting the patient of the patient with (IV). using well known techniques

New polynucleotide sequences obtained from various cDNA libraries, useful

antisense DNA or RNA. as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating

Claim 1; SEQ ID NO 32405; 44pp; English

identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences seqdata.uspto.gov/sequence.html?DocID=20030073623 are useful in diagnostics as expressed sequence tags (EST) The invention relates to an isolated polynucleotide comprising any one 38043 CDNA sequences, appearing as ACH12789-ACH50831, whose sequence was 엺

DB: Alignment Pred. No.: CC AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon CC cancer-associated nucleic acid molecules (N) and proteins (P), where the CC proteins are collectively known as colon cancer antigens. The colon CC cancer antigens have cytostatic activity and can be used in gene therapy CC and vaccine production. N and P may be used in the prevention, diagnosis CC cancelle, N and P may be used to treat disorders associated with diagnosis color cancer antigens to the color cancer associated with inappropriate P expression. For CC example, N and P may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of P by expressing inactive proteins or to complement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids control a host cell and culturing the cell to express the proteins. N and P CC can be used in the prevention, diagnosis and treatment of colorectal CC carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent CC pages 666 to 682 and page 7053 of the sequence listing were missing at CC time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922 US-10-507-132-4 (1-172) Drosophila; developmental pharmaceutical; gene; ss.                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL016176-ABL30511), expressed DNA sequences (ABL016176). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57377-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the isolation of novel human connective tissue related polypeptides (AAU8635-AAU86923) and the polynucleotide (cDNA and genomic) sequences (AAU86435-AAU86923) and the polynucleotide invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with connective tissue(s), including cancer. The polynucleotide sequences of the invention are also useful in gene therapy. ABK42102-ABK43116 represent genomic sequences encoding the novel human connective tissue related polypeptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid encoding novel connective tissue associated polypeptides, used in diagnosing, preventing, treating or ameliorating a disorder such as cancer or rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI;

The polypeptide or polynucleotide is useful for preventing, treating, or ameliorating medical conditions in a mammal. The connective tissue polypeptides, polynucleotides and antibodies are particularly useful for treating, preventing and/or prognosing disorders of connective tissues (e.g. rheumatoid arthritis, discoid and systemic lupus erythematosus, scleroderma, or Sjogren's syndrome), cancers, cancer metastases and/or neoplasias (e.g. leukaemia), neurodegenerative disorders (e.g. alherosclerosis, myocarditis or cardiopulmonary bypass (e.g. atherosclerosis, myocarditis or cardiopulmonary bypass complications), autoimmune diseases (e.g. systemic lupus erythematosus, rheumatoid arthritis, or multiple sclerosis), allergic reactions (e.g.

Also disclosed is a method for evaluating rice blast fungus (Pyricularia oryzae) and Magnaporthe grisea sensitivity to scytalone dehydrogenase inhibitors. The gene is useful for screening for new SCDH inhibitors and evaluating sensitivity to them. The current sequence represents a primer for amplifying the Scytalone dehydrogenase gene sequence.

                                                                                                                                                                                                                                                          The invention relates to a gene encoding scytalone dehydrogenase (SCDH), that functions in the presence of an inhibitor, comprising an optionally mutated, defined amino acid sequence given in the specification. Also disclosed is a method for evaluating rice blast fungus (Pyricularia oryzae) and Magnaporthe grisea sensitivity to scytalone dehydrogenase inhibitors. The gene is useful for screening for new SCDH inhibitors and evaluating sensitivity to them. The current sequence represents a primer for amplifying the Scytalone dehydrogenase gene sequence.

/note="Wector: pBluescriptsK-; Site_1: EcoRI, Site_2:
XhoI; Unidirectional cloning. EcoRI side has T3 primer and predominantly 5' reads. T7 primer on XhoI side of insert.
Strain inoculated into complete medium grown for two days at room temperature, 150 rpm, harvested, blended, reinoculated into complete medium 24 h, room temperature, 150 rpm. Sequences were processed by one of two methods.
Where a full-length alignment to the M. grisea genome sequence was available, the EST sequence was trimed according to the alignment, otherwise sequence quality was assessed using phredPhrap version 991019 and trimmed according to phd files (0.05) and for vector seqs."

/note="Vector: pBluescriptSK-; Site 1: EcoRI; Site 2:
XhoI; Unidirectional cloning. EcoRI side has T3 primer and
predominantly 5' reads. T7 primer on XhoI side of insert.
Strain inoculated into complete medium grown for two days
at room temperature, 150 rpm, harvested, blended,
reinoculated into complete medium 24 h, room temperature,
150 rpm. Sequences were processed by one of two methods.
Where a full-length alignment to the M. grisea genome
sequence was available, the EST sequence was trimed
according to the alignment, otherwise sequence quality was
assessed using phredPhrap version 991019 and trimmed
according to phd files (0.05) and for vector seqs."

/note="Vector: pBluescriptSK-; Site 1: EcoRI; Site 2:
XhoI; Unidirectional cloning. EcoRI side has T3 primer and
predominantly 5 reads. T7 primer on XhoI side of insert.
Strain inoculated into complete medium grown for two days
at room temperature, 150 rpm, harvested, blended,
reinoculated into complete medium 24 h, room temperature,
150 rpm. Sequences were processed by one of two methods.
Where a full-length alignment to the M. grisea genome
sequence was available, the EST sequence was trimed
according to the alignment, otherwise sequence quality was
assessed using phredPhrap version 991019 and trimmed
according to phd files (0.05) and for vector segs."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /clone_lib="Magnaporthe grisea CM Uni-Zap XR Library"
/note="Vector: pBluescriptSK: Site 1: EcoRI; Site 2:
XhoI; Unidirectional cloning. EcoRI side has T3 primer and
predominantly 5' reads. T7 primer on XhoI side of insert.
Strain inoculated into complete medium grown for two days
at room temperature, 150 rpm, harvested, blended,
reinoculated into complete medium 24 h, room temperature,
150 rpm. Sequences were processed by one of two methods.
Where a full-length alignment to the M. grisea genome
sequence was available, the EST sequence was trimed
according to the alignment, otherwise sequence quality was
assessed using phredPhrap version 991019 and trimmed
according to phd files (0.05) and for vector seqs."

XhoI; Unidirectional cloning. EcoRI side has T3 primer and
predominantly 5' reads. T7 primer on XhoI side of insert.
Strain inoculated into complete medium grown for two days
at room temperature, 150 rpm, harvested, blended,
reinoculated into complete medium 24 h, room temperature,
150 rpm. Sequences were processed by one of two methods.
Where a full-length alignment to the M. grisea genome
sequence was available, the EST sequence was trimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /organism="Magnaporthe grisea"

/note=Tvector: pBluescriptsKr; Site_1: EcoRI; Site_2:

XhoI; Unidirectional cloning. EcoRI side has T3 primer and predominantly 5' reads. T7 primer on XhoI side of insert. Strain inoculated into complete medium grown for two days at room temperature, 150 rpm, harvested, blended, reinoculated into complete medium 24 h, room temperature, 150 rpm. Sequences were processed by one of two methods. Where a full-length alignment to the M. grisea genome sequence was available, the EST sequence was trimed according to the alignment, otherwise sequence quality was assessed using phredPhrap version 991019 and trimmed according to phd files (0.05) and for vector seqs."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /cell type="mycelium"

             /note="vector: pBluescriptsK-; Site_1: EcoRI; Site_2: XhoI; Unidirectional cloning. EcoRI side has T3 primer and predominantly 5 reads. T7 primer on XhoI side of insert. Strain inoculated into complete medium grown for two days at room temperature, 150 rpm, harvested, blended, reinoculated into complete medium 24 h, room temperature, 150 rpm. Sequences were processed by one of two methods. Where a full-length alignment to the M. grisea genome sequence was available, the EST sequence was trimed according to the alignment, otherwise sequence quality was assessed using phredPhrap version 991019 and trimmed according to phd files (0.05) and for vector seqs."

/clone="Vector: pBluescriptSK-; Site 1: EcoRI; Site 2:
XhoI; Unidirectional cloning. EcoRI side has T3 primer and
predominantly 5 reads. T7 primer on XhoI side of insert.
Strain inoculated into complete medium grown for two days
at room temperature, 150 rpm, harvested, blended,
reinoculated into complete medium 24 h, room temperature,
150 rpm. Sequences were processed by one of two methods.
Where a full-length alignment to the M. grisea genome
sequence was available, the EST sequence was trimed
according to the alignment, otherwise sequence quality was
assessed using phredPhrap version 991019 and trimmed
according to phd files (0.05) and for vector seqs."

/note="Vector: pBluescriptSK.; Site_1: EcoRI; Site_2:

XhoI; Unidirectional cloning: EcoRI side has T3 primer and predominantly 5' reads. T7 primer on XhoI side of insert. Strain inoculated into complete medium grown for two days at room temperature, 150 rpm, harvested, blended, reinoculated into complete medium 24 h, room temperature, 150 rpm. Sequences were processed by one of two methods. Where a full-length alignment to the M. grisea genome sequence was available, the EST sequence was trimed according to the alignment, otherwise sequence quality was assessed using phredPhrap version 991019 and trimmed according to phd files (0.05) and for vector seqs."

/clone="Vector: pBluescriptSK-; Site 1: EcoRI; Site 2:
XhoI; Unidirectional cloning. EcoRI side has T3 primer and
predominantly 5' reads. T7 primer on XhoI side of insert.
Strain inoculated into complete medium grown for two days
at room temperature, 150 rpm, harvested, blended,
reinoculated into complete medium 24 h, room temperature,
150 rpm. Sequences were processed by one of two methods.
Where a full-length alignment to the M. grisea genome
sequence was available, the EST sequence was trimed
according to the alignment, otherwise sequence quality was
assessed using phredPhrap version 991019 and trimmed
according to phd files (0.05) and for vector seqs."

/note="Wettor: pBluescriptSX-; Site_1: EcoRI; Site_2:
XhoI; Unidirectional cloning. EcoRI side has T3 primer and predominantly 5' reads. T7 primer on XhoI side of insert.
Strain inoculated into complete medium grown for two days at room temperature, 150 rpm, harvested, blended, reinoculated into complete medium 24 h, room temperature, 150 rpm. Sequences were processed by one of two methods. Where a full-length alignment to the M. grisea genome sequence was available, the EST sequence was trimed according to the alignment, otherwise sequence quality was assessed using phredPhrap version 991019 and trimmed according to phd files (0.05) and for vector seqs."
